What is shade variation?

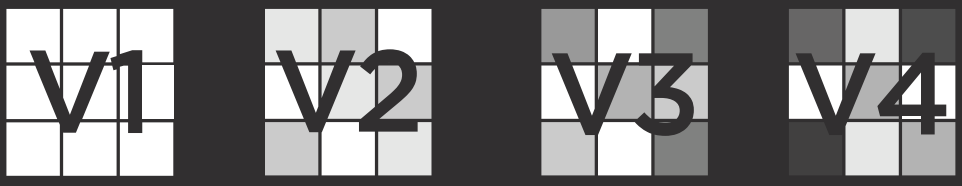
The shade (colour, tone, texture and value) of all ceramic floor tiles vary. To help identify the expected variation, the indicators are:

V1 LOW VARIATION: Least possible shade variation among pieces of tile in a box of this product. When installed, this tile shade provides a uniform appearance and give floors and walls an even harmony.

V2 MODERATE VARIATION: Low to moderate shade variation. Like most natural materials, this tile has a subtle variation that adds a refined modulation to floors and walls.

V3 HIGH VARIATION: Considerable shade variation present among pieces of tile in a box of this product. The tiles share the same core colours, but with more variation between the colours. It provides a spontaneous shade variation within the same colour range that highlights the lustrous texture variations.

V4 RANDOM VARIATION: Highest possible shade variation. For this colours vary from tile to tile. The luxurious shade and colour shifts create customised floor and wall tiles which allow for rich fashion statements to emerge.



Low Variation | Moderate Variation | High Variation | Random Variation

Shade variation is based on production run. Some tiles look the same when they belong to the same production run, but different when they have been produced in different runs.
The changes relate to slight temperature or colouring changes.

RECOMMENDATIONS – Once delivered, check the tiles in all cartons to see if they are the same colour. Also check the code numbers of the boxes to see if they are from the same batch.
